

On correctness

Single-threaded execution guarantees

There is strictly one worker thread at all times. When a new worker is created, the old one is immediately ending its execution, as could be seen in the `SingleThreadExecutorService.startWorker`

Deadlock freedom

There is only a single reentrant lock for every `ConcVarFuture`, and their acquires never intersect.

Starvation freedom

Depends on the fairness of the lock in the `ConcVarFuture`, as there may be multiple threads getting the same future.

Visibility

All field writes and reads are synchronized.
