

1. On correctness

1.1. Deadlock and starvation freedom

We have a thread per every task, they never wait each other(not a single lock used), therefore there can't be deadlocks or starvations.

1.2. Visibility

`thread.start()` is called before the task starts executing, and after initialization of all fields of the future, therefore the new thread sees the `JoinFuture` fully. In `get` we join the worker thread, all writes of the worker thread therefore are visible to the caller thread when `get` returns.
